

Section 3 – Custom Log: When the page loads, I used a styled console.log() to print a custom message to the Console with special colors and formatting.

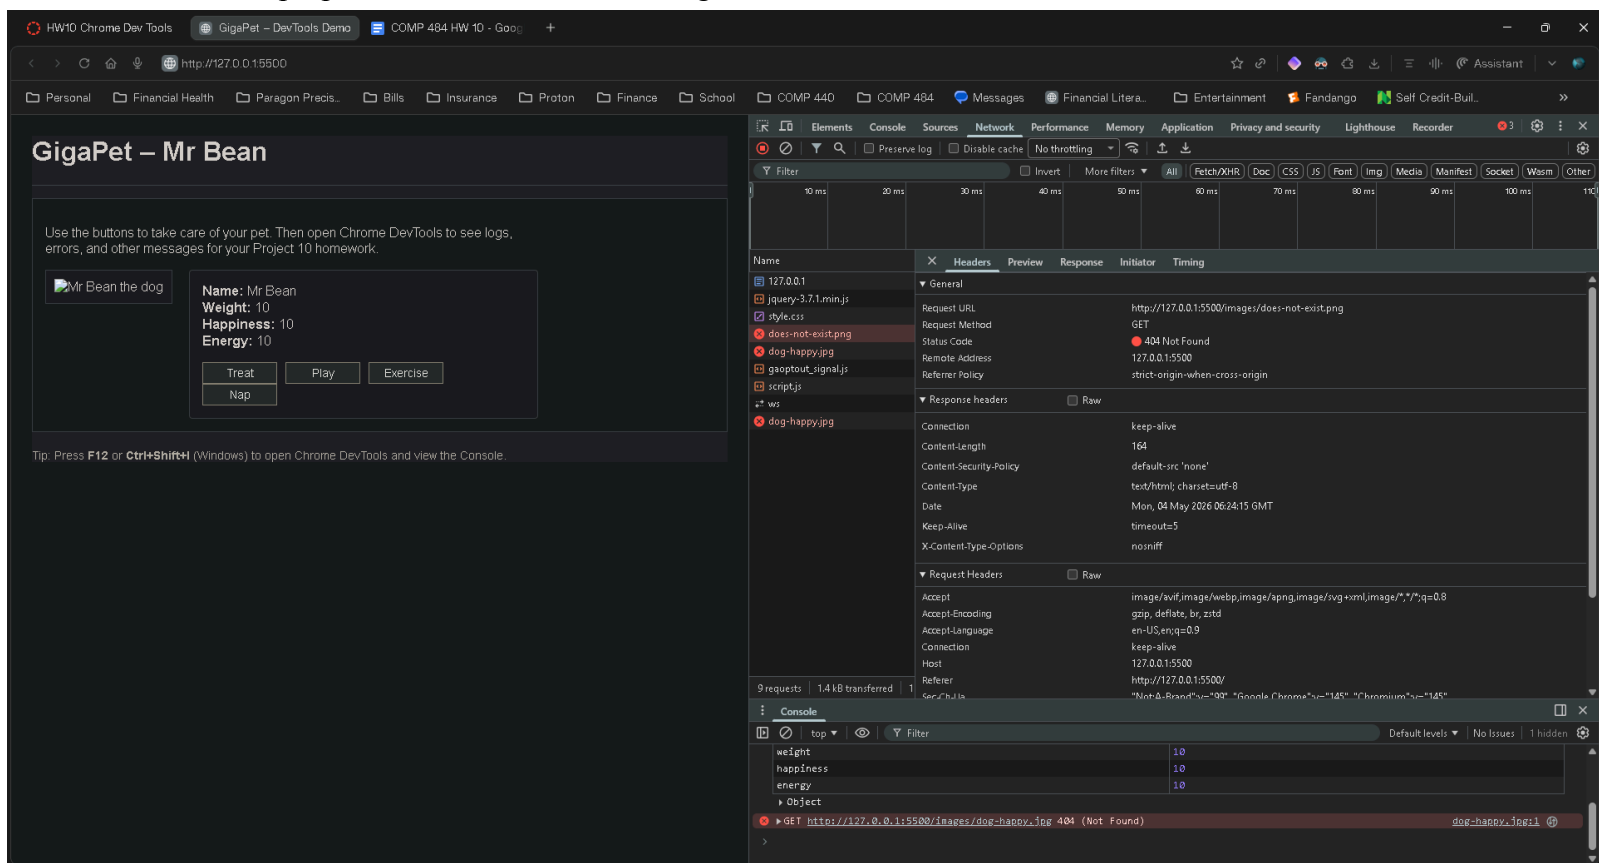

B – Logging (Group, Log, Warn, Table): I clicked Treat a bunch of times. The Console shows a console.group label, a console.log with Mr Bean's stats, a console.warn when he got overfed, and a console.table showing all his stats after the update.

B – Log Error: I clicked Exercise when Mr Bean had 0 energy. console.error() showed up in red and said "Pet is out of energy but exercise was clicked."

C – 404 Network Error: The Network tab shows does-not-exist.png coming back as a 404 Not Found. I put a broken image link in index.html on purpose so the browser would log the error. The Console also shows the same red error at the bottom.

D – TypeError: I typed causeTypeErrorDemo() in the Console prompt. Chrome threw an Uncaught TypeError because the code tried to call .toString() on something that was null. The stack trace shows it happened at line 200 in script.js.

Console

E – Violation: I fired a scroll event with `window.dispatchEvent()` and ran a 10-million-step loop right after to try to trigger a violation. Chrome didn't flag it on my laptop, but both commands show up in the Console and I had All Levels turned on so it would have appeared if it fired.

Console

F1 – Filter by Level: I switched the filter to "Errors only." Only the three 404 errors showed up. All the `console.log`, `console.warn`, and `console.table` messages got hidden — the Console said 3 hidden.

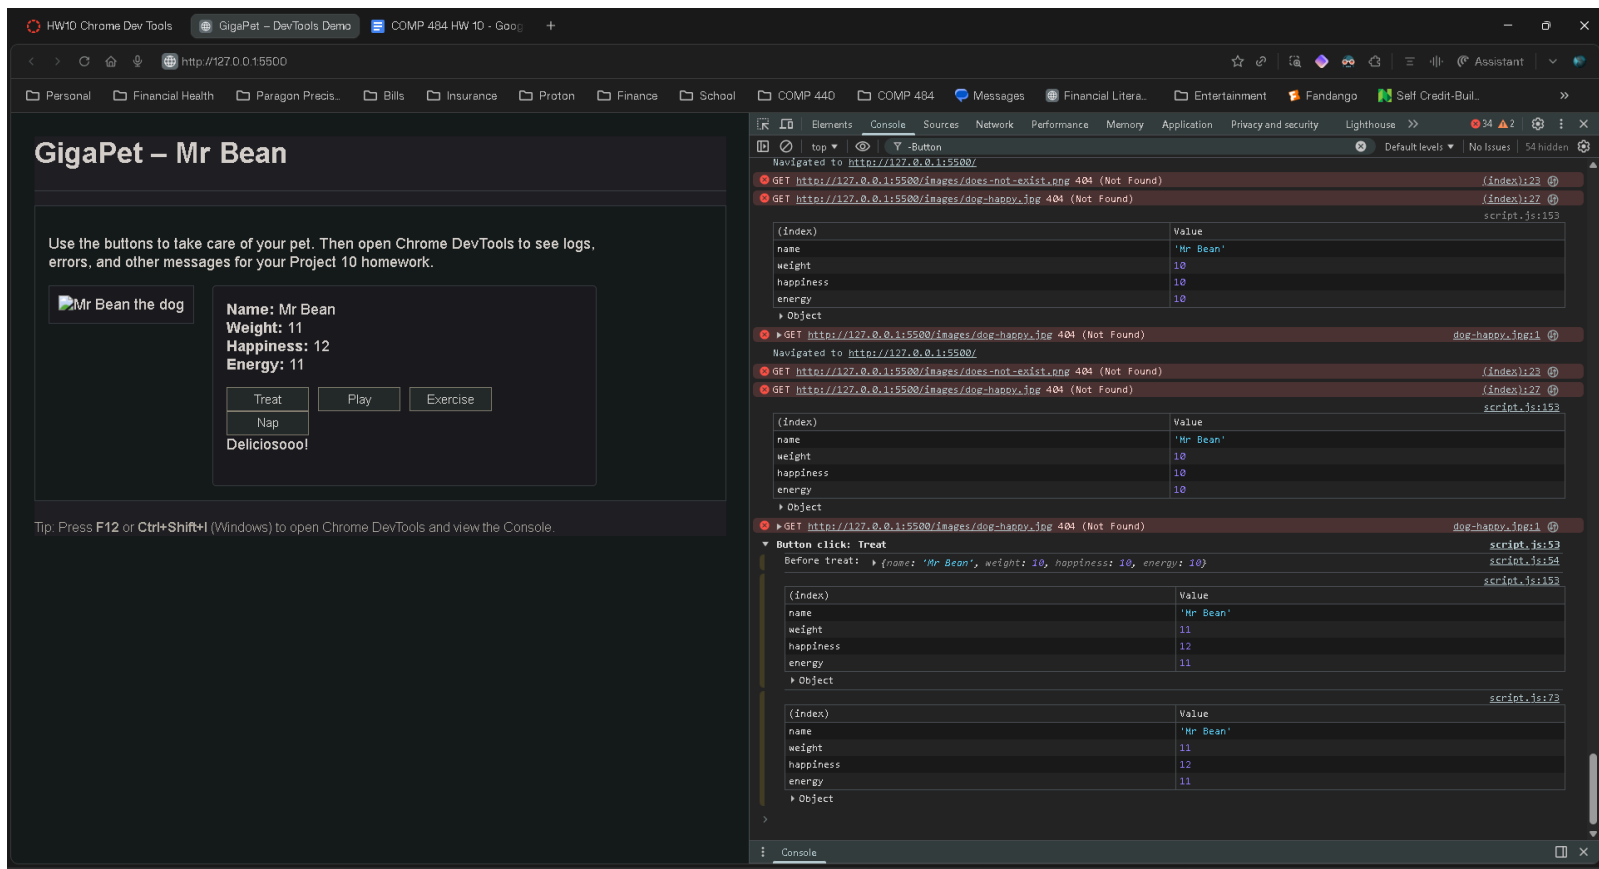

F2 – Filter by Text: I typed "treat" in the filter box at the top of the Console. Only messages with that word showed up, like Button click: Treat and the table logs. All 11 other messages got hidden.

F4 – Regex Filter: I turned on regex mode by clicking the .* button and typed Button in the filter box. It only shows messages that have the word "Button" in them, like Button click: Play and Button click: Exercise. All the other messages got hidden — it says 5 hidden at the top.

F3 – Preserve Log: I turned on "Preserve log" in the Console settings. After refreshing the page, the old messages stayed in the Console instead of being cleared. The line that says "Navigated to http://127.0.0.1:5500/" marks where the reload happened — everything above it survived the refresh.

F – Source URL Filter: I typed script.js in the filter box. The Console only showed messages that came from my script.js file — things like the button click logs and console.table data. The 404 errors from index.html got hidden because they didn't originate from script.js. It says 23 hidden at the top right.
